#### **12.2 Persistence and degradability**

AEROBIC: 2-Chlorophenoxyacetic acid was completely degraded in 47, 124, and 205 days in a Honeoye silt loam, Mardin silt loam, and Dunkirk silt loam, respectively(1). The time required for 80% degradation of 2-chlorophenoxyacetic acid in soil was >360 days in fresh soil and 31.8 days in a soil adapted to MPCA(2).

#### **12.3 Bioaccumulative potential**

An estimated BCF of 3 was calculated for 2-chlorophenoxyacetic acid (SRC), using a log Kow of 1.86(1) and a regression-derived equation(2). According to a classification scheme(3), this BCF suggests the potential for bioconcentration in aquatic organisms is low(SRC).

## 12.4 Mobility in soil

Using a structure estimation method based on molecular connectivity indices(1), the Koc for 2-chlorophenoxyacetic acid can be estimated to be 18(SRC). According to a classification scheme(2), this estimated Koc value suggests that 2-chlorophenoxyacetic acid is expected to have very high mobility in soil(SRC). In addition, the pKa of 2-chlorophenoxyacetic acid is 3.05(3), indicating that this compound will primarily exist as an anion in the environment, and anions generally do not adsorb more strongly to soils containing organic carbon and clay than their neutral counterparts(4).

## 12.5 Other adverse effects

---

# SECTION 13: Disposal considerations

## 13.1 Disposal methods

### Product

The material can be disposed of by removal to a licensed chemical destruction plant or by controlled incineration with flue gas scrubbing. Do not contaminate water, foodstuffs, feed or seed by storage or disposal. Do not discharge to sewer systems.

### Contaminated packaging

Containers can be triply rinsed (or equivalent) and offered for recycling or reconditioning. Alternatively, the packaging can be punctured to make it unusable for other purposes and then be disposed of in a sanitary landfill. Controlled incineration with flue gas scrubbing is possible for combustible packaging materials.
